Preface	V
1 Growth Models	1
1.1 A Growth Model for one Population	1
1.2 Interacting Growth of two Populations	9
1.3 Interacting Growth of $n \geq 2$ Populations	15
1.4 Discretization of the Time-Continuous Model.....	23
1.4.1 The n-Population Model.....	23
1.4.2 The One-Population Model	33
1.5 Determination of Model Parameters from Data.....	36
References	39
2 A Game-Theoretic Evolution Model	41
2.1 Evolution-Matrix-Games for one Population	41
2.1.1 The Game and Evolutionarily Stable Equilibria	41
2.1.2 Characterization of Evolutionarily Stable Equilibria...	45
2.1.3 Evolutionarily Stable Equilibria for 2x2-Matrices	50
2.1.4 On the Detection of Evolutionarily Stable Equilibria ..	52
2.1.5 A Dynamical Treatment of the Game	57

VIII Contents

2.1.6	Existence and Iterative Calculation of Nash Equilibria	62
2.1.7	Zero-Sum Evolution Matrix Games	74
2.2	Evolution-Bi-Matrix-Games for two Populations	79
2.2.1	The Game and Evolutionarily Stable Equilibria	79
2.2.2	A Dynamical Treatment of the Game	83
2.2.3	Existence and Iterative Calculation of Nash Equilibria	88
2.2.4	A Direct Method for the Calculation of Nash Equilibria	93
References	102
3	Four Models of Optimal Control in Medicine	103
3.1	Controlled Growth of Cancer Cells	103
3.2	Optimal Administration of Drugs	111
3.2.1	A One-Compartment Model	112
3.2.2	A Two-Compartment Model	114
3.3	Optimal Control of Diabetes Mellitus	119
3.3.1	The Model	119
3.3.2	On the Approximate Solution of the Model Problem ..	121
3.3.3	A Time-Discrete Diabetes Model	124
3.3.4	An Exact Solution of the Model Problem	127
3.4	Optimal Control Aspects of the Blood Circulation in the Heart	130
3.4.1	Blood Circulation in the Heart	130
3.4.2	A Model of the Left-Ventricular Ejection Dynamics . .	130
3.4.3	An Optimal Control Problem	132
3.4.4	Another Model of the Left-Ventricular Ejection Dynamics	137
References	139
4	A Mathematical Model of Hemodialysis	141
4.1	A One-Compartment Model	141

4.1.1	The Mass Transport in the Dialyzer	141
4.1.2	The Temporal Development of the Toxin Concentration in the Blood without Ultrafiltration	143
4.1.3	The Temporal Development of the Toxin Concentration in the Blood with Ultrafiltration	148
4.2	A Two-Compartment Model	152
4.2.1	Derivation of the Model Equations	152
4.2.2	Determination of the Clearance of the Cell Membranes for Urea	154
4.3	Computation of Periodic Toxin Concentrations	158
4.3.1	The General Method	158
4.3.2	The Case of Constant Clearance of the Dialyzer	162
4.3.3	Discretization of the Model Equations	163
4.3.4	Numerical Results for Urea	167
4.3.5	The Influence of the Urea Generation Rate	170
4.3.6	Determination of the Urea Generation Rate and the Rest Clearance of the Kidneys	171
4.4	A Three-Compartment Model	173
4.4.1	Motivation and Derivation of the Model Equations	173
4.4.2	Determination of the Clearance of the Cell Membranes of the Brain	175
4.4.3	Computation of Periodic Urea Concentration Curves . .	176
4.4.4	Numerical Results	182
	References	183
A	Appendix	185
A.1	A Problem of Optimal Control	185
A.1.1	The Problem	185
A.1.2	A Multiplier Rule	186

X Contents

A.2 Existence of Positive Periodic Solutions in a General Diffusion Model	189
A.2.1 The Model	189
A.2.2 An Existence and Unicity Theorem	190
A.3 Asymptotic Stability of Fixed Points.....	195
Index	201
